

Amendments to the Claims

1. (Currently Amended) A method of enabling a proxy client in a secured network to access a target service on behalf of a user, comprising the steps of:
 - registering proxy authorization information regarding the user with a trusted security server, the proxy authorization information identifying the proxy client and an extent of proxy authorization;
 - submitting, by the proxy client, a proxy request to the trusted security server requesting access to the target service on behalf of the user;
 - comparing, by the trusted security server, the proxy request with the proxy authorization information of the user to determine whether to grant the proxy request;
 - issuing, by the trusted security server, a data structure containing authentication data recognizable by the target service for authenticating the proxy client for accessing the target service on behalf of the user; and
 - accessing, by the proxy client, the target service, the access being in a batch mode without user intervention.
2. (Original) A method as in claim 1, wherein the data structure is a ticket containing a session key for use in a session formed between the proxy client and the target service.
3. (Original) A method as in claim 1, wherein the ticket is encrypted with a secret key shared by the target service and the trusted security server.
4. (Original) A method as in claim 1, wherein the step of comparing determines whether a proxy duration specified by the proxy authorization information has expired.
5. (Original) A method as in claim 1, wherein the step of submitting the request includes transmitting a ticket for authenticating the proxy client to the trusted security server.

Application No.: 09/490,199

6. (Currently Amended) A computer-readable medium having computer-executable instructions for ~~performing~~ a trusted security server to perform the steps:
 - storing proxy authorization information from a user for authorizing a proxy client to act as a proxy of the user;
 - receiving a proxy request from the proxy client to access a target service on behalf of the user;
 - determining, based on the proxy authorization information of the user, whether to grant the proxy request;
 - constructing a data structure containing authentication data recognizable by the target service for authenticating the proxy client for accessing the target service on behalf of the user.
7. (Original) A computer-readable medium as in claim 6, having further computer-executable instructions for performing the step of authenticating the user based on a password of the user before storing the proxy authorization information.
8. (Original) A computer-readable medium as in claim 6, wherein the step of receiving the proxy request includes authenticating the proxy client based on a ticket issued to the proxy client for communicating with the trusted security server.
9. (Original) A computer-readable medium as in claim 6, having further computer-executable instructions for performing the step of sending the data structure to the proxy client for presenting to the target service for authentication of the proxy client.
10. (Original) A computer-readable medium as in claim 6, wherein the data structure is encrypted with a key shared by the target service and the trusted security server.

Application No.: 09/490,199

11. (Currently Amended) A computer-readable medium having computer-executable instructions for a client in a secured network system to perform the steps of:
 - submitting a proxy request to a trusted security server, the proxy request identifying a user and a target service that the client intends to access on behalf of the user;
 - receiving from the trusted security server a session key encrypted with a shared secret key shared by the client and the trusted security server and a ticket for accessing the target service;
 - decrypting the session key with the shared secret key;
 - constructing an authenticator encrypted with the session key;
 - presenting the authenticator and the ticket to the target service for authentication of the client for access of the target service on behalf of the user; and
 - accessing the target service, the access being in a batch mode without user intervention.
12. (Original) A computer-readable medium as in claim 11, wherein the step of submitting the proxy request includes sending a ticket issued to the client for authenticating the client to the trusted security server.
- 13-17. (Cancelled)
